SEPARATOR PAGE PROCESSING SYSTEM

ABSTRACT

5   A method and implementing computer system are provided for
enabling multiple usages of the same printing job separator
page. Separator pages are scanned and an image of the
separator page content is obtained in order to determine the
location on the separator page of prior print job
10   identification information blocks. The prior identification
information block is then obscured and identification
information for a newly queued print job is printed in a new
information block which is positioned in an unused area of
the separator page. The separator pages may be reused until
15   the full extent of each separator page has been filled-up
with used or obscured print job identification blocks.
